

UFW un pare-feu facile

- Objet : Configurer le pare-feu linux (Iptable) simplement
- Niveau requis :
[débutant, avisé](#)
- Commentaires : *Cette petite présentation a pour but de mettre en place quelques mesures de sécurité pour votre ordinateur. Cela ne prendra pas plus de 5 minutes.*
- Débutant, à savoir : [Utiliser GNU/Linux en ligne de commande, tout commence là ! 😊](#)
- Suivi :
 - Création par  martin_mtl le 10/12/2012
 - Testé par  deuchdeb le 29/12/2017
- Commentaires sur le forum : [C'est ici^{1\)}](#)

Installation

C'est tout simple dans un terminal administrateur entrer la commande suivante:

```
apt-get update && apt-get install ufw
```

Utilisation

Syntaxe de base

Mettre en route le pare-feu

Si vous n'avez qu'un accès ssh, surtout assurez-vous avant de démarrer ufw que les règles de ce dernier ne bloque pas SSH (port 22 par défaut) sans quoi votre session ssh cessera et vous ne pourrez plus vous connecter via ssh

```
ufw enable
```

ce qui donne:

```
ufw enable
```

[commande interactive](#)

```
Command may disrupt existing ssh connections. Proceed with operation  
(y|n)?
```

Ce qui veut dire que la connexion SSH peut être interrompue... Pour tout laisser passer avant de

démarrer ufw

```
ufw default allow
```

Cela revient à ne pas avoir de pare-feu mais vous serez certain de ne pas avoir votre connexion SSH coupé. il faudra obligatoirement définir les règles d'ufw après son démarrage

Après de démarrage d'ufw vous pouvez consulter son état et les règles qu'il applique

```
ufw status verbose
```

[retour de la commande](#)

```
Status: active
Logging: on (low)
Default: allow (incoming), allow (outgoing)
New profiles: skip
```

Ici Tout passe!

Arrêter le pare-feu

```
ufw disable
```

Autoriser toutes les connections par défaut

```
ufw default allow
```

Refuser toutes les connections par défaut

Attention si votre unique accès passe par ssh vous serez déconnecté!

```
ufw default deny
```

Autoriser le trafic sur un port

```
ufw allow port
```

Bloquer un port

```
ufw deny port
```

Connaître le numéro d'une règle

```
ufw status numbered
```

Supprimer une règle

```
ufw delete <numéro-de-la-règle>
```

Vérifier l'état du pare-feu

```
ufw status
```

```
ufw status verbose (plus d'info sont fournies)
```

Configuration de base du pare feu

Entrer la commande suivante:

```
ufw enable
```

Une fois que le pare-feu est en route, il l'est toujours. Vous pouvez éteindre l'ordinateur au prochain démarrage le pare feu sera actif

La politique par défaut est la suivante, on autorise les connections sortantes et on interdit les connections entrantes.

Si vous entrez la commande suivante:

```
ufw status verbose
```

Vous aurez ceci comme réponse:

[retour de la commande](#)

```
Status: active
02.Logging: on (low)
03.Default: deny (incoming), allow (outgoing)
04.New profiles: skip
```

You avez ainsi la configuration de base

Pour interdire [le ping](#) (ICMP Echo Request), il faut commenter la ligne suivante dans le fichier /etc/ufw/before.rules:

```
-A ufw-before-input -p icmp --icmp-type echo-request -j ACCEPT
```

Voir : [nano](#)

Exemple de configuration avancée

On met en route le pare-feu

```
ufw enable
```

On bloque tout (rien ne sort, rien ne rentre)

```
ufw default deny incoming
```

```
ufw default deny outgoing
```

On active la journalisation

```
ufw logging on
```

On autorise ensuite les services dont on à besoin

Voir le fichier /etc/services en bas de cette page.

Autoriser l'accès en sortie à un serveur ssh

```
ufw allow out 22/tcp
```

Autoriser l'accès en entré (comprendre de l'extérieur) à un serveur ssh

```
ufw allow in 22/tcp
```

Pour autoriser l'accès en sortie à internet

```
ufw allow out 80/tcp
```

```
ufw allow out 53/udp
```

```
ufw allow out 443/tcp
```

Autoriser l'accès en sortie à un serveur ftp

```
ufw allow out 20/tcp
```

```
ufw allow out 21/tcp
```

Autoriser l'accès en sortie à la messagerie

smtp

```
ufw allow out 25/tcp
```

pop3

```
ufw allow out 110/tcp
```

pop3 sécurisé

```
ufw allow out 995/tcp
```

imap2

```
ufw allow out 143/tcp
```

imap3

```
ufw allow out 220/tcp
```

Autoriser en sortie amule

```
ufw allow out 4662/tcp
```

```
ufw allow out 4665/udp
```

```
ufw allow out 4672/udp
```

Autoriser en sortie bittorrent

```
ufw allow out 6880:6999/tcp
```

```
ufw allow out 6880:6999/udp
```

Autoriser en sortie irc

```
ufw allow out 194/tcp
```

Autoriser en sortie freenode

```
ufw allow out 6667/tcp
```

Pour appliquer les changements

```
ufw disable && ufw enable
```

Pour supprimer une règle

```
ufw delete allow out 80/tcp
```
